McKellar Township

Lake Testing

For

E. coli

June 2025

Bacteria Levels are indicators of water safety,
especially for drinking water and recreational activities like swimming.
E. coli is specifically monitored
because it best indicates potential to harm humans.

Bacterial levels are usually higher after a heavy rain, which
washes bacteria-containing sediment Into the lakes and rivers.
After a couple of sunny days, the ultraviolet radiation
destroys much of the E.coli, but there is always some present,
although it may be at very low levels. An E coli count of less than 10 coliform units (cfu)
per 100 ml is minimal; counts of over 200 cfu per 100 ml are considered unsafe for swimming.

When bacterial counts are high, it is important to avoid swallowing lake water when swimming,
as well as getting water in your ears or opening your eyes underwater.
Showering after a swim is highly recommended.

Water taken directly from a lake or river is not safe to drink at any time
unless it is treated. Treated household water should be tested at least
twice a year, whether it comes from a water body or a well.
Free testing is available through Public Health. Keeping the bacterial levels
in the water low depends on maintaining well-functioning septic
systems, by having regular inspections and pump outs (every few years depending on usage)
and taking care not to damage the septic bed.

Promoting clean water in our lakes and rivers also involves maintaining a
healthy vegetative growth of trees and native long-rooted plants
between the lake and the septic system to
capture the bacteria and other nutrients, such as phosphorus
and nitrogen, before they enter the lake or river.

The following pages contain the most recent E coli levels in six lakes of McKellar
Township from samples collected by MLCA volunteers. Analysis is completed by a
provincially accredited lab paid for by McKellar Township.
Sampling is conducted three times in the summer - at the end of June, July and August.
